

RALLY

Live TV, alive.

Live television should feel alive.

RALLY combines a 50-channel live TV service with an event-led sports product spanning NFL, MLB, NBA, and NHL references. It is designed for a television remote first: four directions, Select, and Back.

THE PROBLEM

Three inherited frictions

- 01 The guide becomes a spreadsheet.
- 02 Sports rights become the user's problem.
- 03 The interface competes with the game.

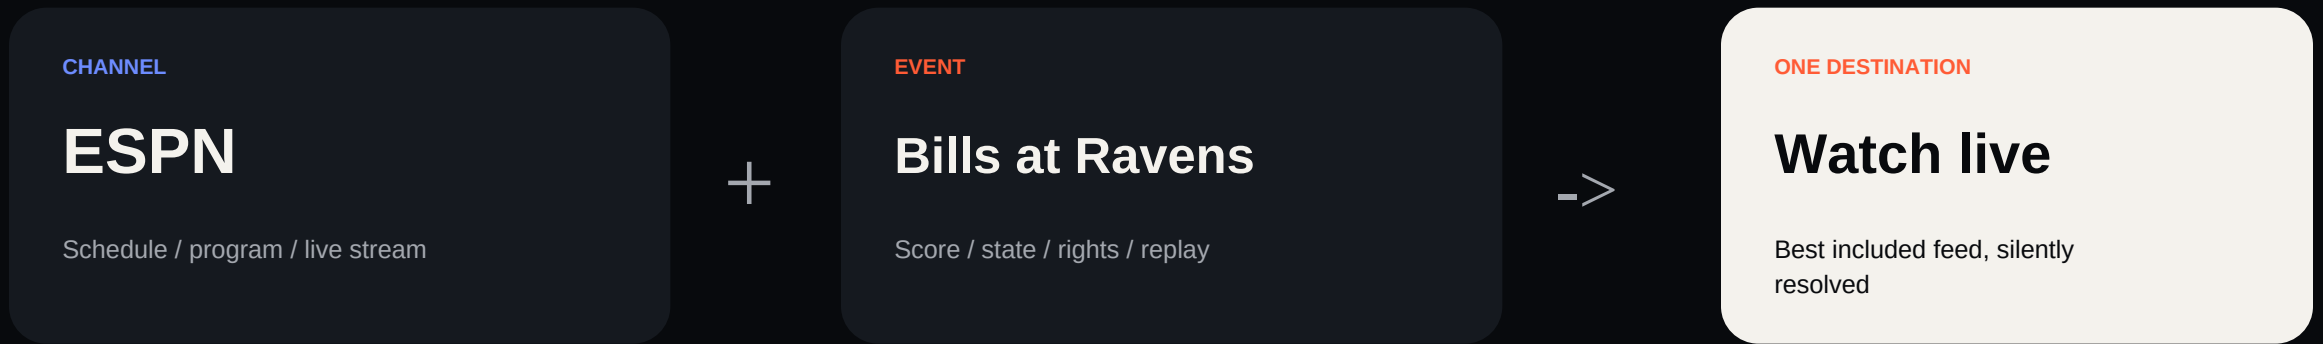

NORTH STAR

The game stays on screen.
The interface moves
around it.

Browse cinematically. Watch invisibly. Scan exactly.

Channels and games are peers, not duplicates.

The user chooses an event. RALLY resolves the best valid live path, alternate feed, replay, or recording without exposing the rights graph.

National, home, language, and radio feeds are described in human terms while playback position is preserved.

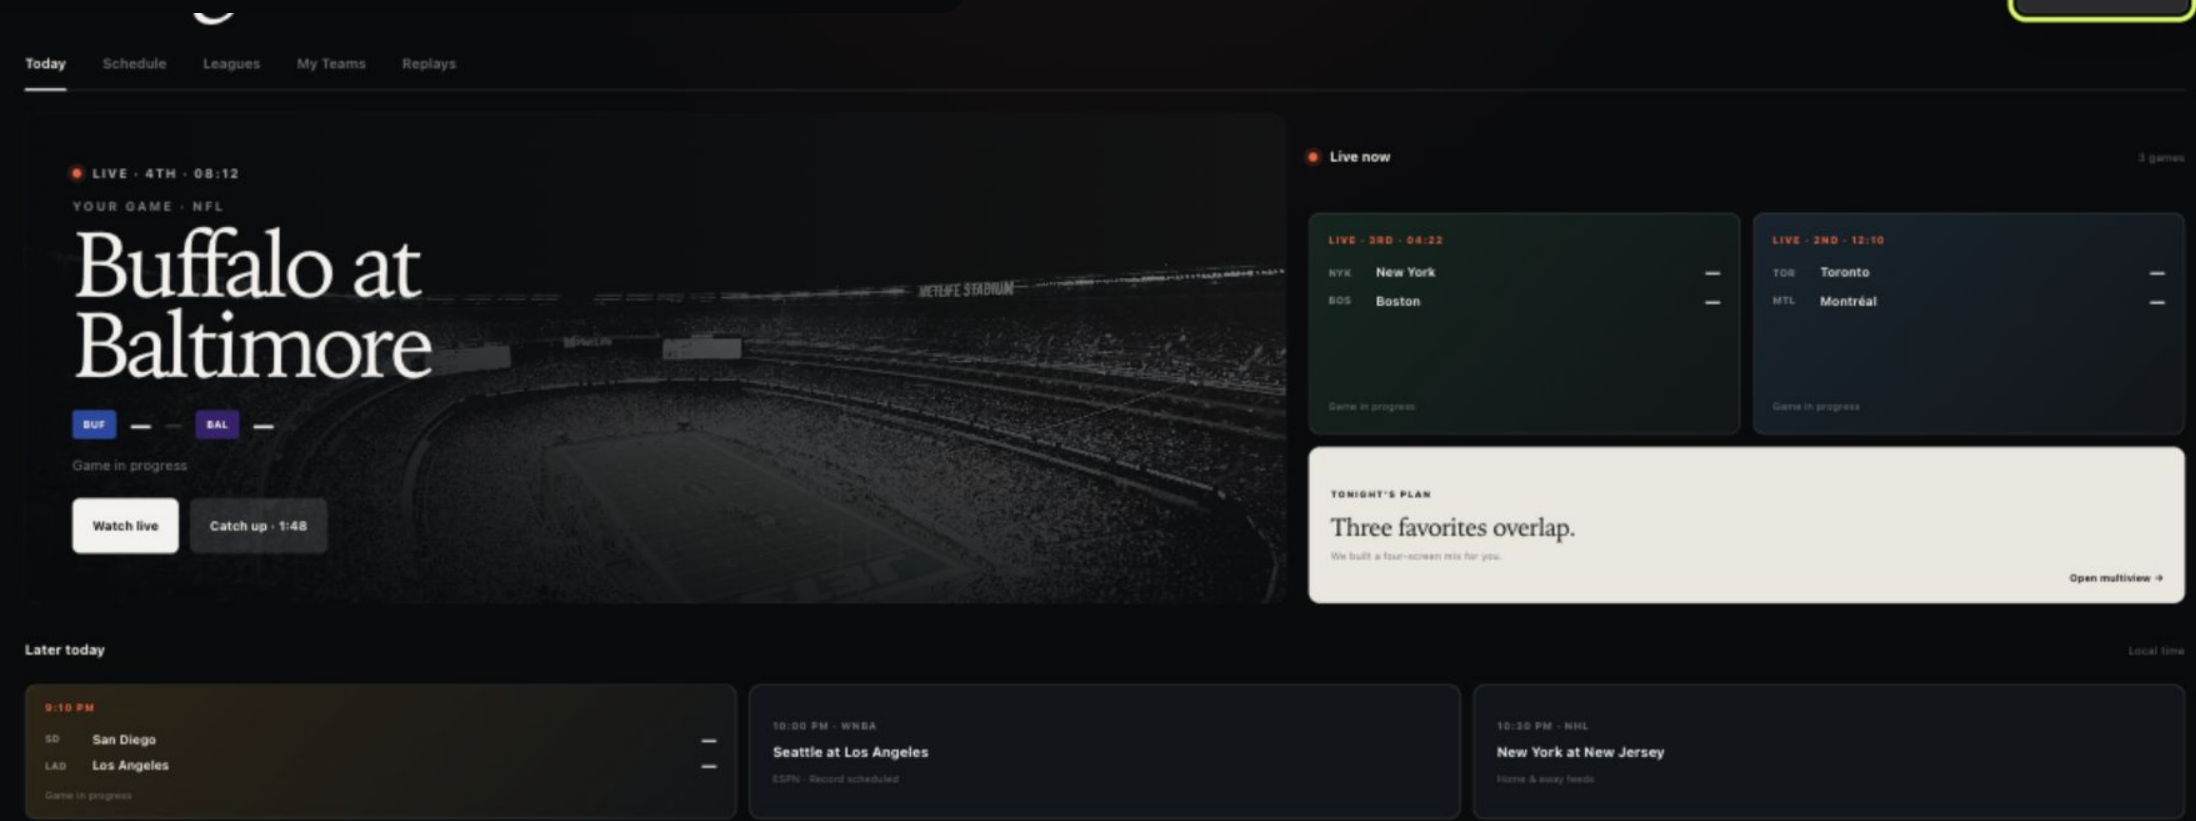

ESPN - Buffalo @ Baltimore
Sunday Night Football

Multiview

Focus changes audio. Select takes a pane full screen. Four simultaneous games use one familiar grammar.

Spoiler Shield

Scores and outcome-aware copy become neutral while teams, navigation, and the fact that a game is live remain useful.

Warm black. Signal coral. Focus only in volt.

League color changes atmosphere, never navigation. Dense information stays opaque and exact. Translucency belongs to temporary decisions over video.

DELIGHT IN THE DETAILS

01 Moment-aware return

Catch up since you left, without exposing the present score.

02 Broadcast memory

Home commentary and language preferences follow the team.

03 Rights, resolved

A blocked feed becomes an available way to watch, not a dead end.

04 The overlap plan

A useful Multiview appears when followed games collide.

What the prototype proves - and what comes next.

DEMONSTRATED

- 50 mock channels with filterable EPG data
- Remote-first spatial focus and focus restoration
- Cross-league Today, Schedule, Teams, and Replays
- Player, feeds, Multiview, search, and preferences
- Spoiler protection, reminders, and recording actions

TEST NEXT

- 01 Can viewers reach any channel without losing time context?
- 02 Do event and broadcast choices feel like one coherent model?
- 03 Is directional focus predictable across variable-width guide cells?
- 04 Does Spoiler Shield hide enough to earn trust?
- 05 Should Multiview be automatic, manual, or both?

Production success: faster time-to-game, fewer wrong tunes, fewer dead-end rights errors, and fewer remote presses per completed task.

Built from platform behavior and proven live-sports patterns.

01 Apple Human Interface Guidelines - Live-viewing apps

02 Android TV - Focus system

03 YouTube TV - NFL Sunday Ticket features

04 MLB.TV - Product features

05 NBA - Multiview

06 Work & Co - PGA TOUR

LIVE CONCEPT

rally-tv.josephrcoakley.chatgpt.site

CONCEPT STATUS

Independent.
Non-commercial.

Static schedules, scores, and rights behavior make the scenario realistic. League, team, channel, and broadcaster names and marks belong to their respective owners.

Reference imagery must be replaced or formally licensed before commercial production.
